Unit I: Structural Organization of Immune Systems

1.....	2
Hematopoiesis: Origin of immune cells	
1.1 Introduction	
1.2 Ontogeny of hematopoietic process in vertebrate	
1.3 Hierarchy of hematopoiesis	
1.4 Cluster of differentiation (CD)	
1.5 Note on types of stem cells	
1.6 Bone marrow niches	
1.7 Growth factors and cytokines involved in hematopoiesis	
1.8 Role of transcription factors	
1.9 Conclusion	
1.10 References	
1.11 Questions and answers	
2.....	26
Cells of the Immune System	
2.1. Introduction	
2.2. Myeloid progenitors	
2.2.1. Granulocytes	

2.2.1.1. Neutrophils	
2.2.1.2. Basophils	
2.2.1.3. Eosinophils	
2.2.1.4. Mast cells	
2.2.2. Agranulocytes	
2.2.2.1. Monocytes	
2.2.2.2. Macrophages	
2.2.2.3. Dendritic cells (DCs)	
2.2.2.3.1. Follicular dendritic cells (FDCs)	
2.2.2.4. Megakaryocytes	
2.3. Lymphoid progenitors	
2.3.1. Lymphocytes	
2.3.1.1. T-lymphocytes	
2.3.1.1.1. CD4 ⁺ T-cells (T-helper cells, Th or T _H cells)	
2.3.1.1.2. CD8 ⁺ T-cells (Cytotoxic T-cells, CTL)	
2.3.1.1.3. $\gamma\delta$ T-cells	
2.3.1.1.4. MAIT cells	
2.3.1.1.5. Natural Killer T-Cells (NKT cells)	
2.3.1.2. B-lymphocytes	
2.3.2. NK cells	
2.4. Antigen-presenting cells	
2.5. Erythroid progenitors	
2.6. Conclusion	
2.7. References	
2.8. Questions and answers	
3	49
Organs of the immune system	
3.1. Introduction	
3.2. Primary lymphoid organs	
3.2.1. Bone marrow	
3.2.2. Thymus	
3.3. Secondary lymphoid organs	
3.3.1. Spleen	
3.3.2. Lymph nodes	
3.3.3. Mucosa-associated lymphoid tissue (MALT)	
3.3.3.1. Bronchus-associated lymphoid tissue (BALT)	
3.3.3.2. Gut-associated lymphoid tissue (GALT)	
3.3.3.3. Nasal-associated lymphoid tissue (NALT)	
3.3.3.4. Skin-associated lymphoid tissue (SALT)	
3.3.3.5. Conjunctival-associated lymphoid tissue (CALT)	

- 3.3.3.6. Larynx-associated lymphoid tissue (LALT)
- 3.3.3.7. Vulvo-vaginal-associated lymphoid tissue (VALT)
- 3.3.3.8. Testis-associated lymphoid tissue (TALT)
- 3.3.4. M cells
- 3.4. Conclusion
- 3.5. References
- 3.6. Questions and answers

Unit II: Functional Aspects of the Immune System

4.....	64
Recognition of antigen: antigenicity and immunogenicity	
4.1. Introduction	
4.2. Antigens	
4.3. Antigenicity	
4.4. Chemical nature of antigens	
4.5. Classification of antigens	
4.5.1 According to their origin or source:	
4.5.2 Immunogenicity	
4.5.3 Help of T-cells for the activation of B-cells	
4.6. Immunogen	
4.6.1 Immunogenicity	
4.6.1.1. Types of immunogenicity	
4.6.1.1.1. Wanted immunogenicity	
4.6.1.1.2. Unwanted immunogenicity	
4.6.2 Specifications for immunogenicity	
4.6.2.1 Nature of immunogen	
4.6.2.2 Contribution of the biological factors.	
4.6.2.3 Method of administration	
4.7. Some related terms	
4.7.1 Superantigens	
4.7.2 Allergens	
4.7.3 Tolerogen	
4.8. Epitope	
4.8.1 Categories of epitopes	
4.8.1.1 Linear epitope	
4.8.1.2 Conformational epitope	
4.9. Antigen–antibody interactions	
4.9.1 Common features of antigen–antibody interactions	
4.9.2 Properties of antigen–antibody interactions	
4.9.2.1 Specificity	

4.9.2.2 Valency	
4.9.2.3 Affinity	
4.9.2.4 Avidity	
4.9.2.5 Cross-reactivity	
4.10 Conclusion	
4.11 References	
4.12 Questions and answers	
5	83
Types of Immunity: innate and adaptive immunity	
5.1. Introduction	
5.2. Types of immunity	
5.2.1. Innate immunity (Natural immunity/ nonspecific immunity)	
5.2.1.1. First line of defense	
5.2.1.1.1 Intact skin	
5.2.1.1.2 Mucous membranes	
5.2.1.1.2.1 Nose	
5.2.1.1.2.2 Ears	
5.2.1.1.2.3 Eyes: Lacrimal apparatus	
5.2.1.1.2.4. Saliva	
5.2.1.1.2.5 Epiglottis of larynx	
5.2.1.1.2.6. Gastric juice	
5.2.1.1.2.7. Urinary tract	
5.2.1.1.2.8. Reproductive tract	
5.2.1.1.2.9. Normal microbiota	
5.2.1.2. Second line of defense	
5.2.1.2.1. Antimicrobial substances	
5.2.1.2.1.1. AMPs	
5.2.1.2.1.2. IBPs	
5.2.1.2.1.3. Interferons	
5.2.1.2.1.4. Complement proteins	
5.2.1.2.2. Phagocytes	
5.2.1.2.3. NK cells	
5.2.1.2.4. Inflammation and fever	
5.2.1.2.5. Pathogen-associated molecular patterns (PAMPs) and pattern-recognition receptors (PRRs)	
5.2.1.2.5.1. Examples of PAMPs	
5.2.1.2.5.2. Recognition of PAMPs	
5.2.1.2.5.2.1. TLRs	
5.2.1.2.5.2.2. CLRs	
5.2.1.2.5.2.3. RLRs	

5.2.1.2.5.2.4. NLRs	
5.2.1.2.6. Acute-phase proteins	
5.2.2 Adaptive immunity (Acquired Immunity/Specific Immunity)	
5.2.2.1. Active immunity	
5.2.2.2. Passive immunity	
5.2.2.3 Characteristics of adaptive immunity	
5.2.2.3.1. Antigenic specificity	
5.2.2.3.2. Diversity	
5.2.2.3.3. Immunogenic memory	
5.2.2.3.4. Distinction between self and nonself	
5.3. Innate and adaptive immunity are highly interrelated	
5.4. Conclusion	
5.5. References	
5.6. Questions and answers	
6	103
Humoral and cell-mediated immunity	
6.1. Introduction	
6.2. Humoral and cellular components of innate and adaptive immune systems	
6.3. Effector mechanisms of humoral immunity	
6.3.1. Functions of antibodies	
6.3.1.1. Fab-mediated functions	
6.3.1.1.1. Fc receptors	
6.3.1.1.2. Fc γ receptors	
6.3.1.2. Fc-mediated functions	
6.4. Effector mechanisms of cell-mediated immunity	
6.4.1. Functions of Th1 lymphocytes	
6.4.1.1. Chronic Th1 cell-dependent macrophage activation (DTH response)	
6.4.2. Functions of Th2 lymphocytes	
6.4.3. Functions of CD8 ⁺ cytotoxic T-lymphocytes	
6.4.3.1. Granule exocytosis pathway	
6.4.3.2. Fas–FasL-mediated cytotoxicity pathway	
6.5. Nonspecific cell-mediated cytotoxicity by NK cells	
6.6. Conclusion	
6.7. References	
6.8. Questions and answers	

Unit III: Immunobiology

7	122
Immunoglobulins: structure and functions	
7.1. Introduction	
7.2. Antibody	
7.2.1. Soluble and membrane-bound form of antibodies	
7.2.2. Immunoglobulin Structure	
7.2.3. Immunoglobulin domains	
7.2.3.1. Immunoglobulin folds	
7.2.3.2. Heavy and light chains	
7.2.3.3. Immunoglobulin fragments	
7.2.3.4. Complementarity-determining regions	
7.3. Immunoglobulin classes	
7.3.1. Immunoglobulin G (IgG)	
7.3.1.1. Structure	
7.3.1.2. Function	
7.3.2. IgA	
7.3.2.2. Structure	
7.3.2.3. Function	
7.3.3. IgM	
7.3.3.1. Structure	
7.3.3.2. Function	
7.3.4. IgD	
7.3.4.1. Structure	
7.3.4.2. Function	
7.3.5. IgE	
7.3.5.1. Structure	
7.3.5.2. Function	
7.4. Paratope	
7.5. Antibody variants	
7.5.1. Isotypes	
7.5.2. Allotypes	
7.5.3. Idiotypes	
7.6. Immunoglobulin superfamily	
7.7. Conclusion	
7.8. References	
7.9. Questions and answers	

8	144
Gene arrangements and class switching of immunoglobulins	
8.1. Introduction	
8.2. Arrangement of immunoglobulin genes	
8.3. Somatic hypermutation	
8.3.1. Recombination at the light-chain locus	
8.3.1.1. RSSs	
8.4. Mechanism of recombination	
8.5. Class-switching recombination of antibodies	
8.6. Conclusion	
8.7. References	
8.8. Questions and answers	
9	162
Activation and regulation of T and B-lymphocytes	
9.1. Introduction	
9.2. Note on reservoirs of immune cells and proteins	
9.3. Thymus-derived cells or T-cells, or T-lymphocytes	
9.3.1. Thymus	
9.3.1.1. Subcapsular region	
9.3.1.2. Cortex	
9.3.1.3. Cortico-medullary junction	
9.3.1.4. Medulla	
9.3.2. TCRs	
9.3.2.1. $\alpha\beta$ TCR	
9.3.2.2. $\gamma\delta$ TCR	
9.4. Characteristics of different developmental stages of T-cells	
9.4.1. Gene rearrangement of TCR	
9.4.2. Selection of T cells	
9.4.2.1. Positive selection	
9.5. T-cell activation and maturation	
9.5.1. Activation of naive CD4 ⁺ T-cells	
9.5.2. Activation of naive CD8 ⁺ T-cells	
9.6. Subset of CD4 ⁺ T-cells or T-helper (Th) cells	
9.6.1. Importance of diverse types of helper T-cells	
9.7. Development and Regulation of B-lymphocytes or bone marrow-derived cells or B-cells	
9.7.1. Development of B-lymphocytes	
9.7.2. Why is IL-7 important?	
9.7.3. B-cell receptor	
9.7.4. Activation and differentiation of B-cells	

- 9.7.4.1. T-cell-independent B-cell activation
- 9.7.4.2. T-cell-dependent B-cell activation
- 9.8. B-1 and B-2 B-lymphocytes
- 9.9. Clonal selection
 - 9.9.1. Clonal selection theory
- 9.10. Kinetics of immune response
 - 9.10.1. Primary response
 - 9.10.1.1. Lag or latent phase
 - 9.10.1.2. Log or exponential phase
 - 9.10.1.3. Plateau or steady phase
 - 9.10.1.4. Decline or decay phase
 - 9.10.2. Secondary response
- 9.11. Conclusion
- 9.12. References
- 9.13. Questions and answers

Unit-IV: Establishment of Immune Responses

10..... 202

Major histocompatibility complex

- 10.1. Introduction
- 10.2. Major histocompatible complex (MHC) domain
- 10.3. Types and location of MHC
 - 10.3.1. Polymorphism of MHC gene
- 10.4. Structure and functions of MHC molecules
 - 10.4.1. MHC class I
 - 10.4.1.1. α chain
 - 10.4.1.2. $\beta 2$ microglobulin ($\beta 2m$)
 - 10.4.1.3. Significance of MHC class I
 - 10.4.2. MHC class II
 - 10.4.2.1. Structure of MHC class II molecules
 - 10.4.2.2. Significance of MHC class II
- 10.5. Antigen processing and presentation
 - 10.5.1. Endogenous pathway of antigen presentation
 - 10.5.2. Exogenous pathway of antigen presentation
- 10.6. Processing and presentation of endogenous and intracellular antigens
 - 10.6.1. T-cell activation
 - 10.6.1.1. Activation of cytotoxic T-cells ($CD8^+$ cells)
- 10.7. Processing and presentation of extracellular or exogenous antigens

10.7.1. Activation of Th cells (CD4 ⁺ cells)	
10.8. Conclusion	
10.9. References	
10.10. Questions and answers	
11.....	221
Complement system activation	
11.1. Introduction	
11.2. Complement proteins	
11.3. Nomenclature of complement proteins	
11.4. Complement-activation pathways	
11.4.1. Classical pathway of complement activation	
11.4.2. MBL pathway of complement-activation	
11.4.3. Alternative pathway of complement activation	
11.5. Effect of complement products on immune responses	
11.5.1. Opsonization	
11.5.2. Cytolysis	
11.5.3. Chemotaxis	
11.6. Regulation of complement activation	
11.7. Conclusion	
11.8. References	
11.9. Questions and answers	
12.....	237
Cytokines and their role in immune regulation	
12.1. Introduction	
12.2. Cells concerned with cytokine production	
12.3. Common features of cytokines	
12.4. Modes of action of cytokines	
12.4.1. Autocrine action	
12.4.2. Paracrine action	
12.4.3. Endocrine action	
12.5. Activity of cytokines	
12.5.1. Pleotropic function	
12.5.2. Redundancy	
12.5.3. Synergy	
12.5.4. Antagonistic	
12.6. Types of cytokines	
12.6.1. The hematopoietin or interleukin (IL) family	
12.6.2. The interferon (IFN) family	
12.6.3. The TNF family	

12.6.4. The chemokine family	
12.7 Cytokines involved in inflammation	
12.7.1 Acute inflammation	
12.7.1.1. Cytokines involved in acute inflammation	
12.7.1.2. Role of TNF and IL-1 in local effects of inflammation	
12.7.1.3. Effects of TNF and IL-1 on endothelial cells	
12.7.1.4. Effects of TNF and IL-1 on leukocytes	
12.7.1.5. Effects of TNF and IL-1 on fibroblasts	
12.7.1.6. Role of TNF and IL-1 in systemic effects of inflammation	
12.7.1.7. Mechanism of fever	
12.7.1.8. Leukocytosis	
12.7.1.9. Production of acute-phase proteins (APPs)	
12.7.1.10. Other effects	
12.7.1.11. Other cytokines participating in acute inflammation	
12.7.2 Chronic inflammation	
12.7.2.1. Cytokines involved in chronic inflammation	
12.8 Functions of cytokines in elevating immune response	
12.8.1 Roles of cytokines in innate immune response	
12.8.2 Roles of cytokines in adaptive immune response	
12.9. Role of cytokines in hematopoiesis	
12.10 Cytokines as therapeutic medicine	
12.11 Cytokine receptors	
12.11.1 Type I cytokine receptors	
12.11.2 Type II cytokine receptors	
12.11.3 Immunoglobulin (Ig) receptor superfamily	
12.11.4 Chemokine receptors	
12.11.5 TNFR superfamily	
12.12. Cytokine receptor-mediated signal transduction	
12.13 Conclusion	
12.14 References	
12.15 Questions and answers	

Unit V: Immune Dysfunction

13.....	262
Autoimmunity	
13.1. Introduction	
13.2. Central tolerance	
13.2.1. Central B-cell tolerance	
13.2.2. Central T-cell tolerance	

13.3. Peripheral tolerance	
13.4. Clonal deletion	
13.5. Receptor editing	
13.6. Anergy	
13.7. Mechanisms of autoimmunity	
13.7.1. Breakdown of T-cell anergy	
13.7.2 Failure of activation-induced cell death (AICD)	
13.7.3 Loss of function of Tregs	
13.7.4 B-cells helped by T-cells	
13.7.5 Sequestered (hidden) antigens at different anatomical location	
13.7.6 Molecular mimicry	
13.7.7 Polyclonal immunity	
13.7.8 Sequestration (hiding) of antigens by organic molecules	
13.7.9 Bystander activation	
13.8 Types of autoimmune diseases	
13.8.1. System-specific autoimmune diseases	
13.8.1.1. Hashimoto's thyroiditis (HT)	
13.8.1.2. Type I Diabetes mellitus (T1DM)	
13.8.1.3. Autoimmune hemolytic anemia (AIHA)	
13.8.1.4. Goodpasture's syndrome (GPS)	
13.8.1.5. Graves' disease	
13.8.1.6 Myasthenia gravis	
13.8.2 Organ-specific autoimmune diseases	
13.8.2.1. Systemic lupus erythematosus (SLE)	
13.8.2.2. Rheumatoid arthritis	
13.8.2.3. Multiple sclerosis (MS)	
13.8.2.4 Mechanisms of occurrence for organ-specific autoimmune diseases	
13.8.2.5. Mechanism of direct cellular damage	
13.9. Diagnosis and treatment of autoimmune diseases	
13.10. Conclusion	
13.11. References	
13.12. Questions and answers	
14.....	284
Hypersensitivity	
14.1. Introduction	
14.2. General features of hypersensitivity reactions	
14.3. Classification of hypersensitivity reactions	
14.3.1. Immunological aspects of hypersensitivity	

14.3.1.1. Type I hypersensitivity reactions	
14.3.1.2. Type II hypersensitivity reactions	
14.3.1.3. Type III hypersensitivity reactions	
14.3.1.4. Type IV hypersensitivity reactions	
14.4. Mechanisms behind hypersensitivity reactions	
14.4.1. Type I hypersensitivity	
14.4.1.1. Pathogenesis of type I hypersensitivity	
14.4.2. Type II hypersensitivity	
14.4.2.1. Pathogenesis of type II hypersensitivity reaction	
14.4.2.1.1. Intrinsic antigens	
14.4.2.1.1.1. Proteins that are part of the cell membrane	
14.4.2.1.1.2. Antigens present on the matrix in between cells	
14.4.2.1.1.3. Receptor antigens of cells	
14.4.2.1.2. Extrinsic antigens	
14.4.2.1.2.1. Blood transfusion reaction	
14.4.2.1.2.2. Deposition of drug metabolites	
14.4.2.2. Regulation of type II hypersensitivity	
14.4.2.2.1. Opsonization and phagocytosis	
14.4.2.2.2. Complement activation	
14.4.2.2.3. ADCC	
14.4.3. Type III hypersensitivity	
14.4.3.1. Pathogenesis of type III hypersensitivity	
14.4.3.1.1. Phase of immune complex formation	
14.4.3.1.2. Phase of immune complex deposition	
14.4.3.1.3. Phase of immune complex-mediated inflammation and tissue injuries	
14.4.4. Type IV hypersensitivity	
14.4.4.1. Pathogenesis of type IV hypersensitivity	
14.5. Conclusion	
14.6. References	
14.7. Questions and answers	
15.....	307
Immunodeficiency and transplantation biology	
15.1. Introduction	
15.2. Immunodeficiencies	
15.2.1. Primary immunodeficiencies (PIDs)	
15.2.1.1. Impairment of T-cell functions	
15.2.1.2. Impairment of B-cell functions	
15.2.1.3. Complement deficiency	

- 15.2.1.4. Primary phagocytic disorders
- 15.2.1.5. Diagnosis of PIDs
- 15.2.2. Secondary Immunodeficiency (SIDs)
- 15.3. Transplantation biology
 - 15.3.1. Immunology of graft rejection
 - 15.3.1.1. Mechanisms mediate direct and indirect allorecognition pathway
 - 15.3.1.2. Isolation of HSCs for transplantation
 - 15.3.1.3. Acute GVHD
 - 15.3.1.4. Chronic GVHD
 - 15.3.2. Management of GVHD
 - 15.3.2.1. Immunosuppressive mechanisms to circumvent graft rejection
- 15.4. Conclusion
- 15.5. References
- 15.6. Questions and answers

Unit VI: Immunization

- 16..... 338
- Development of vaccine technology
 - 16.1. Introduction
 - 16.2. Development of vaccines
 - 16.2.1. Preparation of vaccines
 - 16.2.2. Characteristics of vaccines
 - 16.2.3. Routes of administration
 - 16.2.4. Efficiency of vaccine
 - 16.2.5. Vaccines boost immunity level
 - 16.3. Immunization schedule followed in India
 - 16.4. Herd immunity
 - 16.6. References
 - 16.7. Questions and answers
- 17..... 355
- Types of vaccines and vaccination
 - 17.1 Introduction
 - 17.2. Different types of vaccines
 - 17.2.1. Live attenuated vaccines
 - 17.2.2. Inactivated or killed vaccines
 - 17.2.3. Toxoid vaccines
 - 17.2.4. Subunit vaccines

17.2.5. Conjugated vaccines	
17.2.6. DNA vaccines	
17.2.7. Recombinant vector vaccines	
17.2.8. Cellular vaccines	
17.3. Conclusion	
17.4. References	
17.5. Questions and answers	
18.....	372
Vaccine design based on clinical requirements	
18.1. Introduction	
18.2. Design of vaccines	
18.3. Components of a vaccine	
18.3.1. Antigens	
18.3.2. Adjuvants	
18.3.3. Stabilizers	
18.3.4. Antibiotics	
18.3.5. Preservatives	
18.3.6. Administration route	
18.3.7. Doses	
18.4. Clinical trial of vaccines	
18.4.1. Phase I clinical trial (first in humans)	
18.4.2. Phase II clinical trial	
18.4.3. Phase III (pivotal studies)	
18.4.4. Phase IV (post-marketing examination)	
18.5. Conclusion	
18.6. References	
18.7. Questions and answers	
 Unit VII: Immunotechniques	
19.....	390
Immunoreactions: antibody and antigen interaction	
19.1. Introduction	
19.2. Immunoreactions	
19.2.1. Properties of antigen–antibody interaction	
19.2.2. Factors affecting antigen–antibody interaction	
19.3. Conventional and advance immunotechniques	
19.3.1. Precipitation reaction	
19.3.1.1. Direct antigen-capture method	
19.3.1.2. Indirect antigen-capture method	

- 19.3.2. Immunoprecipitation
 - 19.3.2.1. Immunoprecipitation reaction in solution
 - 19.3.2.1.1. Ring test
 - 19.3.2.1.2. Flocculation test
 - 19.3.2.2. Immunoprecipitation reaction in gels
- 19.3.3. Immunodiffusion reactions
 - 19.3.3.1. Single diffusion in one dimension (Oudin procedure)
 - 19.3.3.2. Single diffusion in two dimensions (radial immunodiffusion or Mancini method)
 - 19.3.3.3 Double diffusion in one dimension (Oakley–Fulthorpe procedure)
 - 19.3.3.4 Double diffusion in two dimensions (Ouchterlony double immunodiffusion)
 - 19.3.3.5 Applications of double diffusion in two dimensions
 - 19.3.3.5.1 Precipitation in agar with an electric field
 - 19.3.3.5.2 Types of immunoprecipitation
 - 19.3.3.5.3 Individual protein immunoprecipitation (IP)
 - 19.3.3.5.2.2. Co-Immunoprecipitation (Co-IP)
 - 19.3.3.5.2.3. Chromatin immunoprecipitation (ChIP)
 - 19.3.3.5.2.4 Ribonuclear protein immunoprecipitation (RNP-RIP)
 - 19.3.3.5.6 Application of immunoprecipitation

ABOUT THE AUTHORS

Dr. Seema Tripathy, the author of this book, worked as a research scientist in the field of Biotechnology. Her research career involved working as a postdoctoral fellow (PDF) in the School of Biological Sciences at the National Institute of Science Education and Research (NISER), Bhubaneswar, and Women Scientist-A (Department of Science and Technology, Government of India) at Centre for Biotechnology, Siksha 'O' Anusandhan (Deemed to be University), Bhubaneswar. She obtained her postgraduate degree from the

University of Hyderabad and pursues her Ph.D. in Biotechnology from Utkal University, Bhubaneswar. Her doctoral research was focused on the derivation, differentiation, and cryopreservation of fish embryonic stem cells. She utilized her expertise in stem cell isolation and developed a pipeline to isolate stem cells from unconventional resources like breastmilk and urine, which can be obtained via non-invasive procedures. She developed a cost-effective and simple protocol for the culture of breastmilk-derived mesenchymal stem cells (BmDMSCs) which have a huge potential in biomedical applications involving the regeneration of injured tissues and repair of impaired organs. She is very passionate to develop stem cell technologies for use in biomedical practices toward human welfare. She authored the book on human anatomical and physiological systems published by VIVA publication house, India. She has high number of publications in reputed peer-reviewed journals and also filed a couple of patents. She felt the lack of a good quality, quick grasping and simple book on immunology during her tenure as a postgraduate student lecturer at Ravenshaw University. This need has eventually motivated her to write this book for undergraduate and postgraduate level students.

Ms. Rashmi Rekha Sahu, the second author of this book has obtained her post-graduation degree in Biochemistry from Ravenshaw Autonomous University, Cuttack. She is an excellent student having in-depth knowledge of science, particularly biochemistry and chemistry. The need of a book describing concepts and mechanisms of immunology in simple manner inspired her to write this book on immunology.

Figure 8.1. Gene arrangements of immunoglobulins

Figure 8.2. Deletion mutation

Figure 8.3. Overview of V(D)J recombination. Diversity (D) and joining (J) gene segments in the germline DNA are joined together through somatic recombination at the heavy-chain locus. The V gene segment is then joined to the recombined D–J gene to produce the fully recombined heavy-chain exon. The recombined DNA is transcribed, and the primary RNA transcript is then spliced, bringing together the V and constant (C) regions. The spliced mRNA molecule is translated to produce the immunoglobulin protein. H, hinge

Figure 8.5. Position of RSSs at V, D, and J gene segments at the κ chain, λ chain, and H chain locus

Figure 8.6. Types of RSSs

Figure 8.7. Type of spacers present at V, D and J gene segments

Figure 8.8. Mechanism of V(D)J recombination. RAG endonucleases consist of RAG1 and RAG2 initiate DSBs between the participating V(D)J gene segments and their flanking RSS. RAG cleavage generates a pair of blunt signal ends (SEs) and a pair of covalently sealed hairpinned coding ends (CEs). While SEs are directly and precisely ligated by the enzyme Ligase IV/XRCC4/XLF to form a signal joint (SJ), the hairpin CEs have to first be opened by DNA-PKcs/Artemis and then add nucleotides TdT and join by ligase to form a coding joint.

Figure 8.9. Formation of specific class of immunoglobulin

Figure 9.1. The humoral and cell-mediated branches of the immune response. The humoral branch comprises lymphocytes of the B-cell lineage. Antibodies are the effector molecules produced by this response. The process begins with the interaction of B-cell receptors (BCRs) with antigens. Binding of the antigen promotes differentiation into antibody-secreting cells (plasma cells). The cell-mediated branch comprises lymphocytes of the T-cell lineage. T-helper cells (Th cells) and cytotoxic T cell (CTL). Antibody production depends on cytokines released by Th cells; thus, T h cells is intercellular bridge between cell mediated immune response and humoral response.

Figure 9.2. Bone marrow niches. In the marrow, osteoblasts and endothelial cells comprise the major cellular components that contribute to the both endosteal and vascular niches. The involvement

of MSCs along with HSCs and other cellular fractions are responsible to maintain “HSC niche

Figure 9.6. The process of thymocyte development. Schematic representation showing the different cell surface markers expressed in key stages of T-cell development thymus, including double negative (DN), double positive (DP), and CD4 and CD8 single positive (SP) stages BM, bone marrow; ETP, early T lineage precursor.

Figure 9.7. T-cell receptor α - and β -chain gene rearrangement

Figure 9.8. Selection of T cells in thymus. CD4+CD8+ double positive (DP) T cells express an unselected repertoire of $\alpha\beta$ T-cell receptors (TCRs). DP cells that express TCRs that recognize self-peptide–MHC ligands with high affinity undergo apoptosis (negative selection), whereas DP T cells that are bound to an MHC-associated peptide with low affinity differentiate into either CD4+ or CD8+ single positive (SP) thymocytes (positive selection). SP thymocytes are exported from the thymus and populate the peripheral lymphoid organs. The repertoire of peripheral T cells that has survived both positive and negative selection is both self-MHC restricted and self-tolerant.

Figure 15.4. Two distinct pathways of allorecognition. A. Direct pathway of allo-recognition. Donor APCs like dendritic cells holding

alloantigens migrate from the graft to secondary lymphoid organs to activate T cells, provoking an immune response. B. Indirect pathway of allo-recognition. Graft proteins are collected and processed by recipient dendritic cells and presented to T cells and facilitate immune response. APCs: antigen-presenting cells, TCR: T cell receptor, MHC: major histocompatibility complex

Figure 15.5. HSCs can be isolated from bone marrow, peripheral blood, or umbilical cord blood and then transplanted into an immunocompromised host

Figure 15. 6. Mechanism of GVHD

Figure 16. 1. Generation of memory B cells. Naive B cells upon stimulated by antigen, undergo clonal expansion and form clusters of activated B cells known as extrafollicular foci. These activated B cells either differentiate into short-lived plasma cells, or they can migrate back into the follicle and initiate a germinal center reaction. After expansion and maturation, germinal center B cells differentiate to both long-lived plasma cells that produce high affinity antibodies and memory B cells that have high affinity B cell receptors. Memory B cells most likely self-renew themselves by homeostatic proliferation. Memory B cells may also regularly differentiate, in an antigen-dependent or antigen-independent manner, into long-lived plasma cells to maintain long-term antibody production

Figure 16. 2. Generation of memory T cells. When naive T cells encounter a pathogen, they proliferate, giving rise to many effector T cells that fight infection and die when the infection is over. Pathogen infection also results in the formation of long-lived memory T cells that rapidly respond to a previously encountered antigen. A, One model for memory-T-cell formation proposes that the precursor cells that give rise to memory T cells and effector T cells both arise independently from naive T cells. B, In another model, a subset of effector cells gives rise to memory T cells
